

Find the segment driving the change

THE SITUATION

A segment dropped 50%. Does that matter?

You need 3 things at once:

- value in segment
- share of total volume
- how it moved vs prev period

Here's [metric] broken down by [dim]: [data].
Find the segment with the highest impact.
Consider: value, share of total, change vs prev.
Give a % of how much this segment contributes.
Flag any segments moving against the total.

Bypass permissions

WHAT WE GOT

One clear answer, not a list of movers.

The "against the total" flag is where the real story usually hides.
